Tire swing climbing knots

1 Find an old and unwanted tyre that's right. Make sure the tire is relatively clean and make sure it is still in good enough condition not to divide under the weight of people. The bigger the tire, the better, up to a point. While you want plenty of children's room to sit in the tire, a very large tire will be particularly heavy and can weigh too much for a standard tree branch. Use your good judgment on the perfect balance between size and weight for your specific branch. 2 Clean the tyre. Give the tire a good wash down with heavy detergent, washing all the outer surface and rinsing the inside as well. If a dirty tire cleans well, then it should be good to use. Use WD40 or a tyre cleaning product to remove stubborn grease stains. People will sit on this rubber, so the more gunk you remove, the better. Be sure to get any cleaner residue off as well! 3 Find a suitable branch where you can hang the tyre swing. The tree branch itself should be thick and sturdy, around 10 inches (25cm) minimum diameter. Make sure the tree is large and healthy, with no sign of weaknesses that could indicate the tree is unstable. An insulated maple or oak usually works best. [1] The branch you choose will have an impact on the length of the rope you will need. Good dimensions for a tire swing branch are about 9 feet (2.7 feet) from the solid tree branch to the ground. The branch should come out far enough away from the tree that when you hang the swing of tires on it, the swing will not immediately hit the trunk of the tree. While you do not want to place swing tires at the very end of a branch, you can not attach within a few meters of the trunk. The larger the branch of the tree, the more the tyre swing will swing. So if you make a tire swing for a small child, you may want to choose a branch that is smaller on the ground. 4 Purchase the rope. Get about 50 feet (15.2 meters) of rope. It should be quality rope that will not break or break when the weight is applied to it. There are a variety of ropes that you can use for swing tires, would be heavy climbing ropes or utility rope, but you can also use the chain if you want. On a simple swing of galvanized chain tires will take longer, but the rope is easier to handle, will potentially do less damage to the tree branch, and it is easier to hold on to children. In addition to the quality rope, the frustration can be prevented by applying the tubes to the length of the rope where it is most likely (wherever it comes into contact with the tree, tyre and hands). 5 Holes some drainage holes in the tyre. As this will be in the rain, the water will accumulate inside the tire if left solid. To avoid any accumulated water, drill three holes in the tyre to what will become its base. Be careful when drilling through the tyre. There may be metal wires on the inside of the tyre, which you can hit with the drill. Just be prepared that you might hit a different layer while drilling through. 6 Use a ladder to get to the branch. Branch. Be sure to position the ladder safely so as not to flip it. Having a friend hold it steady as you climb is a wise precaution. If you don't have a ladder, you'll have to find another way to get rope over the branch. Find a roll of duct tape or something of equivalent weight and tie too at the end of the rope. Then throw the adhesive tape over the branch so that the rope is now curled over the branch. Once the rope is curled over the branch, untie the adhesive tape or whatever you used as weight for the end of the rope. 7 Place the rope over the tree branch. Position the rope so that it is not rubbed by knots or imperfections on the branch. You may want to wrap the rope around the branch a few times, just to make sure it stays in place. If you bought tubes, this part of the rope should have anti-fraray tubes at either side of it (if it is based on the branch). 8 Attach this end of the rope to the tree branch using a bowl or fisherman's curve. (Do not use a square node. Square nodes were designed as a first aid node. If you pull back on each loose end, it will fall apart.) Make sure the knot is solid. If you don't realize you're doing one, find someone who can. If you have curled the rope over the branch of the ground, you will need to tie a sliding knot from the ground and then tighten it up so that it cinches up to the branch. 9 Tie the other end of the rope around the top of the tyre. Again, use a square knot to fasten the rope around the top of the tire. Before you tie the knot, judge how far you want the tire to be from the ground. The tyre should clear any obstacles on the ground and should be large enough so that your child's feet do not pull on the ground, so it should be at least one foot from the ground. On the other hand, it shouldn't be so big that your child can't get into it on its own. Make sure the tyre is at this height when you fix the knot. Remember to keep the drainage holes at the bottom, with the top of the tire opposite the side with the holes. 10 Cut out any excess rope. Tie the tail of the rope up so that it won't accidentally get in the way or come undone. 11 Fix the ground under the cradle if you like. Add mulch or dig over the ground to make a softer surface for landing when jumping (or falling) off the tire swing. 12 Test the swing. Check that the swing is sitting well for swinging. Before you allow others on the swing, test your handiwork with a spotter nearby, in case something goes wrong. If it works well, you and your children are ready to start swinging. There are three knots used to tie a swing to the tires, and these include the knot double, knot hook cloves and knot grip line stretched, all of which secure the tire in place. Make a tire swing from a tree branch with instructions from a climbing instructor in this free video on the knot binding. This site is not available in your country I have 3 holes in the tire and some rope. It's going to be a horizontal tire. Horizontal. 2 8 comments Photo: mymommysplace.comSometimes the simplest things can bring the greatest pleasures of summer. That's what I felt when I discovered this delightful swing tire tutorial on MyMommysPlace. Here's to make a swing of light-peasy tires, old-fashioned! INSTRUMENTS AND MATERIALS Available on Amazon - Tires - Pipe - Power drill - Oh, and you need a tree (a large tree)Photo: mymommysplace.comSTEP 1: Clean TiresFirst, give the tire a thorough cleaning with a pressure washing machine. If you don't have the right tool, take the tyre to the car wash to clean it with one of the high-pressure hoses on the premises. STEP 2: Drilling drainage holes in the tyreWhen you are ready, ie when you are satisfied with the cleanliness of the tire - holes a series of holes in the bottom of the tire to prevent pooling of water when it rains. STEP 3: Hang the ropeUse a ladder to reach a sturdy tree branch to secure the rope. Note: Your scale is much higher than it looks. Watch out there! If you prefer not to take any chances, here's a solution: Put a softball in a socks and tie the socks to the end of the rope, before throwing the ball over the branch. STEP 4: Tie a slip knotNow, tie a slip knot and pull on it, causing the knot to travel up until the branch finally reaches. You end up with a double rope of uneven size. STEP 5: Suspend the tyreKnow the rope around the tire using a square knot. (Don't do as I do and attach the tire using the rope with a bunch of knots that you know how to do!) STEP 6: Test the tire swingHave the hardest member of your family test swing to ensure its power. You may not want to tell this person why he or she was chosen.... STEP 7: Enjoy! Let your impatient child swing already. You can cut the excess rope later. Pat yourself on the back and admire your work on the street, just like the neighbors will. Photo: mymommysplace.com Let me give you some final notes. I used components that were valued at a capacity greater than anything that would be on the swing. S-hooks were valued at over 600 pounds, Clip Hook was over 500 pounds, Connector links were over 500 pounds, and swivel was over 400 pounds. This means that any adult who can fit between chains, or can sit on the tire, will be safely owned by the hardware used. If you want, you can certainly use lighter components that will naturally cost less money. But, I wanted to test the swing tire, and I'm 200 pounds, so I wanted to make sure it was safe! So I went with double weight protection just to be sure. Everything except the tyre cost about 60 You could buy the kit from one of the playset manufacturers. The kit runs just one hair under \$100.00. Doing it this way gave me the flexibility to do what I wanted and hang it I wanted, and saved money along the way. If anyone has any comments, I'm interested in hearing them. But don't ask me to do an instructable on how to build the completed playset! I'm going to. To. Two elevated forts with a swing between them & a walkway above them, tho vertical supports for forts are planned to use phone poles! And if someone uses this to build their own tire swing, I'd like to know. Know.
